

MacroMind

Overview:

MacroMind is a native iOS nutrition tracker built around one idea — that logging what you eat should take seconds, not minutes. You describe your meal in plain language, and the app figures out the rest. No barcode scanning, no searching databases, no manual entry.

Project Type:

This is a self-initiated project, built entirely by me.

Role & Contribution:

I designed and built the entire application from scratch:

- **AI Integration:** Connected Google's Gemini AI to process natural language meal descriptions and return accurate macronutrient breakdowns in a structured format.
- **Networking Layer:** Built a resilient URLSession networking layer with a custom Codable decoder to handle edge cases in the AI's JSON responses gracefully.
- **Apple Health Integration:** Used HealthKit to write all nutrition data directly to the user's Apple Health app, keeping everything on-device — a deliberate privacy decision, not a default.
- **Data Visualisation:** Built dynamic weekly charts using Swift Charts so users can actually see patterns in how they eat over time.
- **App Architecture:** Structured the entire app with MVVM to keep the codebase clean and scalable from the beginning.

Impact:

MacroMind makes nutrition tracking accessible to people who gave up on every other app because the process felt like a second job. By reducing logging to a single natural language input, it removes the biggest reason people stop — friction. The app was built for me first, and that made it better.

Learning Outcomes:

Building this taught me that the hardest product decisions have nothing to do with code. I spent more time deciding what not to build than building what's there. I also came to understand Apple HIG not as a set of rules but as a design philosophy — and that shift changed how I approach every screen I build.

Suggested Meal Plan

Breakfast

4-egg omelet with cheese and vegetables (onions, peppers), whole-wheat toast (2 slices) with avocado

Lunch

Large salad with grilled chicken breast (6oz), mixed greens, cherry tomatoes, cucumbers, and a light vinaigrette dressing

Dinner

Salmon (4oz) baked with roasted vegetables (broccoli, carrots, sweet potatoes) and quinoa (1 cup)

HuesOfMe

Overview:

HuesOfMe is a native iOS mood journal that replaces the blank page with a color. You pick a hue that matches how you feel, add a note if you want, and over time the app builds a visual mosaic of your emotional patterns — something a text journal never quite manages to show you.

Project Type:

This is a self-initiated project, designed and built entirely by me.

Role & Contribution:

As the sole developer, I handled the full product from concept to build:

- **UI/UX Design:** Designed and built the entire interface in SwiftUI, following Apple's Human Interface Guidelines throughout — clean, calm, and out of the way.
- **Data Persistence:** Used SwiftData for on-device storage, keeping all entries private and fast without any backend dependency.
- **iOS Ecosystem Integration:** Built a Home Screen Widget using WidgetKit and set up secure data sharing between the app and widget using App Groups.
- **User Engagement:** Added streak tracking and gentle reminders through UserNotifications — present enough to be useful, quiet enough not to be annoying.

Impact:

The app gives people a low-friction way to check in with themselves daily. Most journaling apps fail because starting feels hard. HuesOfMe makes it feel like nothing — which is exactly the point. The mosaic that builds up over time becomes genuinely interesting to look at.

Learning Outcomes:

This project pushed me beyond thinking about just the app itself and into the wider Apple platform. Managing data flow between the app and its widget extension, understanding how App Groups work, and building something that lives on the Home Screen — it fundamentally changed how I think about native development.

Chorus

Overview:

Chorus is an immersive full-stack platform for exclusive, design-led merchandise drops. It was built to make a product launch feel like an event — using 3D rendering and scroll-based animations to build anticipation and tell a story before anyone even sees a buy button.

Project Type:

This is a Co-founded Initiative, built with a creative business partner to create a new standard for launching music-related merchandise.

Role & Contribution:

As the technical co-founder, I owned the entire platform development:

- **Full-Stack Architecture:** Architected and built the complete application using Next.js and TypeScript.
- **API Development:** Built a fully typesafe API layer using tRPC for clean, reliable communication between client and server.
- **Advanced Animations:** Created the platform's immersive experience using Framer Motion and GSAP — scroll-based animations, parallax effects, and 3D rendering that make the product feel alive before you interact with it.
- **Performance Optimisation:** Spent significant time ensuring that heavy visual assets loaded fast and ran smoothly, because an immersive experience that lags defeats its own purpose.

Impact:

The first drop on Chorus moved 400+ units profitably with zero paid ads and no external funding. The platform worked because it made buying feel like being part of something, not just completing a transaction.

Learning Outcomes:

The biggest thing I took from Chorus wasn't technical — it was about collaboration. My co-founder owned brand and creative completely. I didn't touch it. They didn't touch the code. That boundary was what made the product actually good, and it shaped how I think about working with people now.

RentO

Overview:

RentO is a peer-to-peer rental marketplace for everyday assets — cameras, audio gear, gaming consoles — built to replace the informal, trust-based WhatsApp sharing that already happens in creative communities with something structured, payment-protected, and reliable for both sides.

Project Type:

This is a Group Project, co-built with Megh Patel who handled business strategy and go-to-market entirely.

Role & Contribution:

As the technical co-founder, I owned the full architecture and development:

- **Full-Stack Platform:** Built the complete marketplace using Next.js, TypeScript, Tailwind CSS, and shadcn/ui.
- **Booking Lifecycle:** Engineered the entire two-sided booking system across request, approval, active rental, and return states — every transition handled cleanly with proper status management.
- **Payment Integration:** Integrated Stripe with a custom webhook handler to process real transactions and handle failures, refunds, and edge cases properly.
- **Authentication and Asset Management:** Set up Clerk for auth and UploadThing for listing image uploads so owners have a complete tool to manage their gear.
- **Database Design:** Designed the full schema using Prisma ORM with PostgreSQL via Supabase.

Impact:

RentO solves a real problem that already exists — people in creative communities lend gear all the time, but with no protection on either side. The platform gives both the owner and the renter a proper system they can trust, which makes the exchange happen more often and with less anxiety.

Learning Outcomes:

Building a two-sided marketplace is a different kind of problem than building an app with one user type. Every decision affects two people with opposite needs on the same platform. The Stripe webhook work also taught me how real payment systems behave when things go wrong — which is something you can't learn from documentation alone.

GoSeek

Overview:

GoSeek is a subscription-based freelance marketplace that connects Indian SMBs with verified local talent. It exists in the gap between expensive global platforms and informal referrals — making on-demand hiring fast, affordable, and actually accessible for businesses that can't justify a full-time hire.

Project Type:

This is a Co-founded Initiative, built with Megh Patel who owns sales, business development, and all client relationships.

Role & Contribution:

As the technical co-founder, I own all product development and technical decisions:

- **Platform Architecture:** Built the full product using Next.js 14, TypeScript, and Supabase, including the subscription model logic and freelancer verification flow.
- **UI and Brand:** Implemented the GoSeek brand experience with Framer Motion animations, Poppins typography, and a design system built to communicate trust and simplicity to SMB users.
- **Product Strategy:** Every feature on the roadmap comes through me — what we build, what we cut, and what we defer based on what Megh is hearing from clients directly.

Impact:

GoSeek is live at goseekus.com and currently in active go-to-market. Indian SMBs paying 20%+ commission to global platforms or relying on referrals have no real middle ground today. GoSeek is that middle ground.

Learning Outcomes:

This is the first product I've built with real market pressure from day one. Building alongside someone who speaks to clients every week and pushes back from a sales perspective has completely changed how I make product decisions. Technical choices stopped being purely technical the moment they had a direct cost or revenue consequence attached.

• NOW BUILDING — BE AMONG THE FIRST

Freelancing is *broken.* We're rebuilding it.

"Seek, Work, Elevate!"

GoSeek is a premium freelancing ecosystem where elite talent meets serious business — built on trust, structured growth, AI-powered workflows, and a community that actually gives a damn.

JOIN AS FREELANCER

HIRE ON GOSEEK

Early access is invite-only. Join the waitlist to secure your place.

THE PLATFORM

Everything the freelance *world was missing.*

Verified Profiles

Every freelancer on GoSeek is verified. No fake portfolios. No ghost contractors.

Structured Progression

Explorer → Master → Legend. A career path with real meaning, real rewards, and real visibility.

AI-Powered Matching

Smart matching connects the right freelancer to the right business — before either side has to search.

Secure Escrow Payments

Milestone-based payments with full escrow protection. Freelancers get paid. Businesses get delivery.

Community Layer

Not just a marketplace. A global network of peers, mentors, and collaborators who actually elevate each other.

Enterprise Workflows

Built from day one for serious businesses — compliance, analytics, team collaboration, and dedicated support.
